

## #301175 ADJUSTABLE UPPER DECK T1FK'05

The upper deck is strategically milled at the front to provide the required flexibility and torsion which makes the top deck great for low grip conditions. As grip increases, you can stiffen the upper deck by installing aluminum braces. The first stage is to install the middle connection brace which will stiffen the top deck in front-to-rear flex but still provides sufficient flex to the sides. The next stage is to install the side braces, which will remove unwanted side flex and will dramatically stiffen the top deck. The stiffest top deck setting is best suited for high-grip racing conditions.
