

#306220 CENTER SERVO MOUNT

The new Center Servo Mount made from graphite allows the servo to be mounted to the chassis without touching it. The servo is mounted using three stands and without any other modifications. With this new servo mounting method, unwanted chassis tweak is eliminated while at the same time it provides more overall traction. The new servo mounting position improves the balance of the car as the servo is mounted more in the center of the chassis.

NOTE

Remove this screw from the alu steering post and use it here.
